

# North Yorkshire Joint Strategic Needs Assessment 2019 Airedale, Wharfedale and Craven CCG Profile

## Introduction

This profile provides an overview of population health needs in Airedale, Wharfedale and Craven CCG (AWC CCG). Greater detail on particular topics can be found in our Joint Strategic Needs Assessment (JSNA) resource at <a href="https://www.datanorthyorkshire.org">www.datanorthyorkshire.org</a> which is broken down by district. This document is structured into five parts: population, deprivation, disease prevalence, hospital admissions and mortality. It identifies the major themes which affect health in AWC CCG and presents the latest available data, so the dates vary between indicators.

## **Summary**

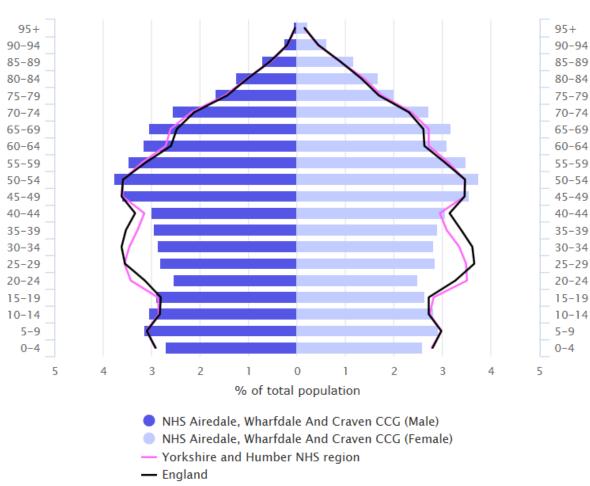

- Life expectancy is not significantly different from England. For 2011-2015, female life expectancy in AWC CCG is 83.3 years (England: 83.1), and male life expectancy is more than three years lower than for females at 79.8 years (England: 79.4) [1].
- There is a high proportion of older people. In 2017, 21.2% of the population was aged 65 and over (33,600), higher than national average (17.3%). Furthermore over 4,800 (3.0%) were age 85+, compared with 2.3% in England. [2]
- Some children grow up in relative poverty. In 2015, there were 14.9% of children aged 0-15 years living in low income families, compared with 19.9% in England [1].
- There are areas of deprivation. Within the CCG, 19 Lower Super Output Areas (LSOAs) out of a total of 97 are amongst the 20% most deprived in England, and 11 out of these 19 LSOAs are amongst the 10% most deprived in England. These 11 LSOAs are all in the Keighley Central, Keighley West and Keighley East wards in Bradford [3].
- Many people have longstanding health problems. The census in 2011 showed 27,500 people living with long-term health problem or disability (17.4% compared to 17.6% in England) [1].
- The highest reported rates of ill health are from: hypertension (15.3%); obesity (11.6%); depression (10.7%); diabetes (7.3%); and asthma (7.2%) [4].
- Hospital admissions vary according to admissions route. Non-elective admissions are most frequently due to respiratory problems (15.7%); injury, poisoning and certain other consequences of external causes (11.9%); and circulatory diseases (11%). Elective admissions are most common for neoplasms (19.6%); factors influencing health status (13.6%); and digestive disorders (13%) [5].

# **Population**

There are 16 general practices in AWC CCG area with 159,000 <u>registered patients</u> (December 2018) [6]. In contrast, the ONS mid-year resident population estimate for 2017 gave a CCG-wide population of 159,800 [7]. The GP registered population in AWC CCG is 0.5% lower than the resident population, whereas in England, the registered population is 7% higher than the resident population.

The resident population is forecast to rise to 164,400 by 2025 (2.3% increase since 2018) and 169,400 by 2040 (5.4% increase since 2018) [8]. In England, the corresponding increases are 4% by 2025 and 10.3% by 2040. Local population growth is forecast to be lower than that seen nationally.

There is a high proportion of people aged over 65 (21.2%) in the AWC CCG compared with England (17.3%). The proportion of people aged 5-14 (11.9%) is slightly higher than England (11.6%). The following age profile shows a lower proportion of the population in age groups 0-4 and 20-39 years, and a higher proportion in age groups 50-95+, compared with both England and the Yorkshire & Humber region.

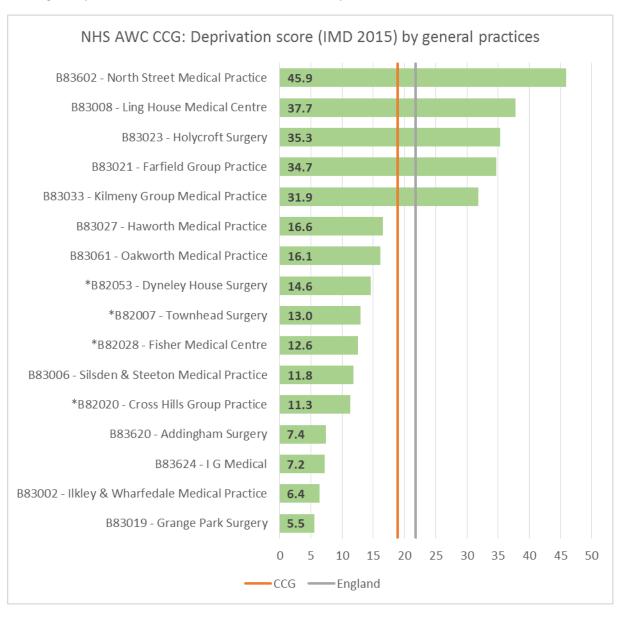

Age Profile – GP registered population by sex and five-year age band 2017

Source: National General Practice Profiles, PHE

## **Deprivation**

In 2015, there were 14.9% of children aged 0-15 years living in low income families, compared with 19.9% in England [1]. The 2015 Index of Multiple Deprivation (IMD) identifies 19 Lower Super Output Areas (LSOAs) out of a total of 97 across the CCG which are amongst the 20% most deprived in England, and 11 out of these 19 LSOAs are amongst the 10% most deprived in England. These 11 LSOAs are all in the Keighley Central, Keighley West and Keighley East areas in Bradford. Two LSOAs in Skipton South, Craven are amongst the 19 LSOAs (20% most deprived in England) [3]. A list of these 19 LSOAs can be found in Appendix 1.

Deprivation scores, using IMD-2015, have been estimated for general practices. They show five practices in AWC CCG have populations experiencing higher levels of deprivation than England, although they are not within North Yorkshire's boundary.

Source: National General Practice Profiles, PHE

IG Medical is based in Ilkley (Bradford), with a branch in Grassington (North Yorkshire)

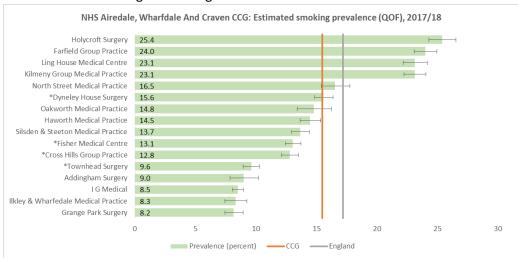

<sup>\*</sup> Practices within North Yorkshire.

# Lifestyle and behaviour

The lifestyle choices that people make and behaviours they follow in their lifetime can all have an impact on both their current and future health. Lifestyle diseases are defined as diseases linked with the way people live their life. This is commonly caused by alcohol, drug and smoking abuse as well as lack of physical activity and unhealthy eating.

#### **Smoking**

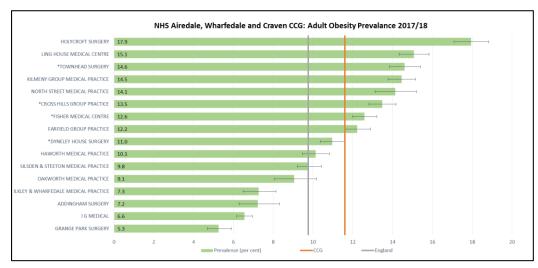

AWC CCG has the second highest estimated rate of smoking in North Yorkshire, after Scarborough & Ryedale CCG, in 2017/18. Although the rate is high when compared to other CCGs in North Yorkshire, AWC CCG has a lower rate of smoking prevalence compared to England. Five practices have rates which are significantly higher than England and nine practices have significantly lower rates than CCG and England averages.

Source: National General Practice Profiles, PHE

### **Adult obesity**

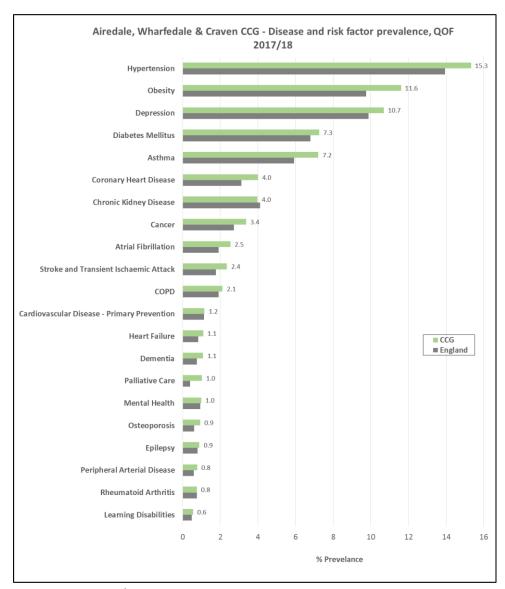

There is a higher rate of adult obesity in AWC CCG compared with England, with around 14,700 people on the register. Seven out of the 16 practices have rates which are significantly higher than both the CCG average and England and seven practices have rates significantly lower than the CCG average. Four practices have rates significantly lower than England.

Source: NHS Digital

## **Disease Prevalence**

In AWC CCG, hypertension, obesity and depression are the most common health problems, followed by diabetes and asthma. The prevalence for most diseases and risk factors is higher in AWC CCG than for England.

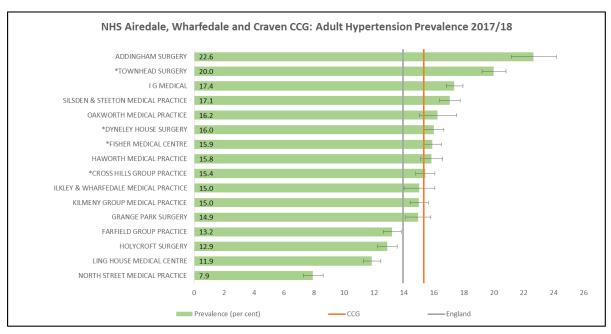

Source: NHS Digital

## Disease prevalence by general practice

The following charts use the NHS Quality and Outcomes Framework prevalence data for 2017/18. These are expressed as crude percentages, without taking account of variation in the populations between general practices. Differences such as the proportion of elderly patients, ethnicity and levels of deprivation may affect crude prevalence rates. The charts are presented in order of recorded prevalence, from highest to lowest. Practices within North Yorkshire are indicated by an asterisk (\*).

## Hypertension

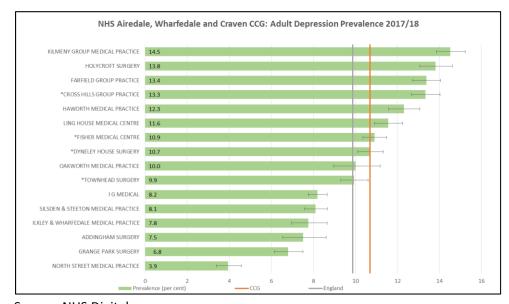

In AWC CCG, there are around 24,400 people with known hypertension and prevalence is higher than England. Twelve general practices have rates significantly higher than England, whilst four have significantly lower rates.

Source: NHS Digital

#### Depression

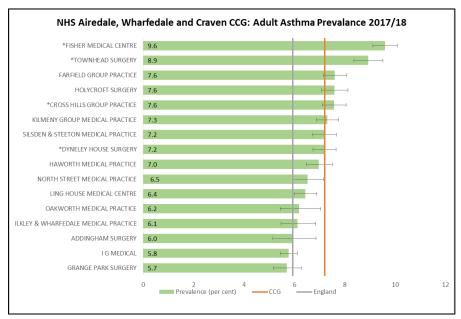

There are more than 13,500 people with a record of depression in AWC CCG, which is a slightly higher rate than seen in England. Eight practices have rates which are significantly higher than England, while six practices have significantly lower rates than both England and the CCG average.

Source: NHS Digital

#### **Asthma**

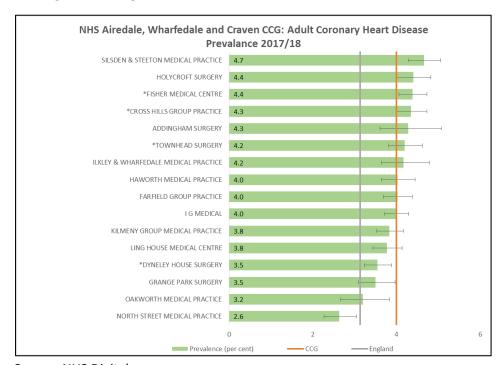

In AWC CCG, asthma prevalence is higher than England. There are around 11,500 people on asthma registers. Nine out of 16 practices have asthma prevalence rates which are significantly higher than England. The other seven practices have a recorded prevalence which is similar to England.

Source: NHS Digital

## Coronary heart disease

Coronary heart disease (CHD) prevalence is higher in AWC CCG compared with England and there are around 6,400 people with diagnosed CHD. Most general practices (13 of the 16) have prevalence rates significantly higher than England. Silsden & Steeton Medical Practice has a prevalence rate 50% higher than England.

Source: NHS Digital

Consideration can be given to variation which may be due to modifiable risk factors within the population, differences in record keeping, variation in health care and access to services. <a href="NHS RightCare">NHS RightCare</a> produces a range of intelligence products to help local health economies identify and address health inequality.

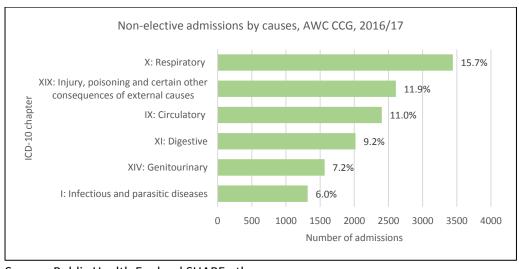

Furthermore, the NHS Health Check is a health check-up for adults in England aged 40-74, designed to spot early signs of stroke, kidney disease, heart disease, type 2 diabetes or dementia. As individuals age they have a higher risk of developing one of these conditions and an NHS Health Check helps find ways to lower this risk. The NHS Health Check report for North Yorkshire highlights performance of health checks across North Yorkshire and can be found on Data North Yorkshire.

# **Hospital admissions**

In 2016/17, there were just over 63,000 hospital admissions for AWC CCG registered patients, of which 41,553 (65.5%) were elective admissions and 21,909 (34.5%) were non-elective admissions. In total, there were 126 providers, with Airedale NHS Foundation Trust being the main provider.

Hospital admissions by provider, AWC CCG, 2016/17							
Provider	Proportion of	Proportion of	Proportion of				
	elective	non-elective	all admissions				
	admissions	admissions					
Airedale NHS Foundation Trust	74.8%	86.8%	78.9%				
Bradford Teaching Hospitals NHS	7.9%	5.8%	7.1%				
Foundation Trust							
Leeds Teaching Hospitals NHS Trust	7.0%	4.6%	6.2%				
Ramsay Healthcare UK Operations Ltd	6.5%		4.3%				
Harrogate & District NHS Foundation Trust	1.1%						
Remaining providers	2.8%	2.8%	3.5%				
Source: Public Health England SHAPE atlas							

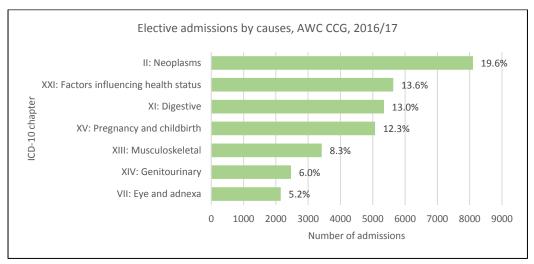

The main reasons for non-elective admissions are shown below for causes which contributed towards more than 5% of non-elective admissions. Respiratory diseases are the most common reason for non-elective admission followed by injuries & poisoning and circulatory diseases.

Source: Public Health England SHAPE atlas

Within chapter XIX: Injury, poisoning and certain other consequences of external causes, the main reasons for admission are: poisoning by non-opioid drugs; fracture of femur; fracture of lower leg; and superficial head injury. This suggests drug overdose (accidental or otherwise) and falls may contribute importantly to local emergency admissions.

The main reasons for elective admission are similarly shown for causes which contributed towards more than 5% of elective admissions. Neoplasms represent the highest proportion of elective admissions, followed by factors influencing health status and digestive diseases.

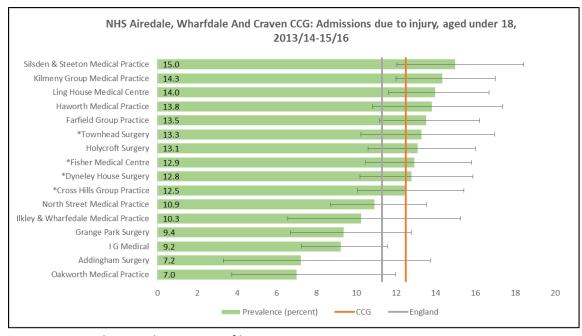

Source: Public Health England SHAPE atlas

For *chapter XXI: Factors influencing health status*, the leading reasons for admission are: supervision of normal pregnancy; liveborn infants according to place of birth; special screening for neoplasms; and follow-up examination after treatment for malignant neoplasm.

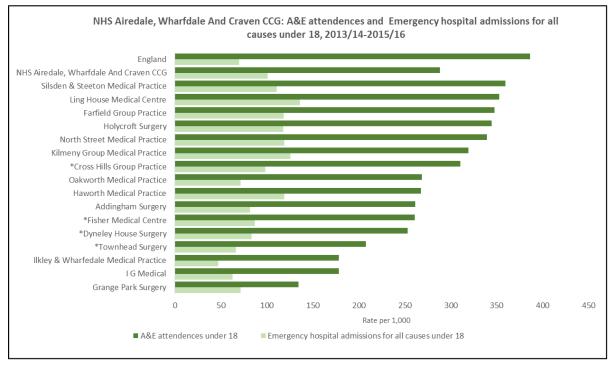

### **Under 18 hospital admissions**

AWC CCG has a slightly higher rate of admissions due to injury for those under compared to England. Over half of practices in AWC CCG have higher rates than the England and CCG average.

Source: National General Practice Profiles, PHE

AWC CCG has the highest rate of emergency hospital admissions for all causes under 18 when compared to other CCGs in North Yorkshire. The rate is also higher than the England average. However, AWC CCG has a rate of A&E attendance under 18 which is lower than the England average.

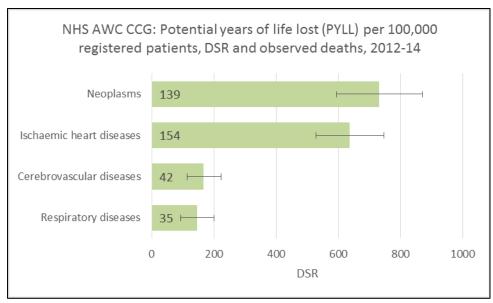

Source: National General Practice Profiles, PHE

Public Health England produces a summary health profile for AWC CCG (Appendix 2). This compares more than 50 indicators with national data and highlights those which are significantly different from England. This can be used to help inform topics which might be considered for focused improvement work. In particular, it highlights the following as being significantly worse than England:

- Provision of 1 hour or more unpaid care per week (%)
- Emergency admissions in under 5s (Crude rate per 1,000)
- Emergency hospital admissions for CHD (SAR)
- Hospital stays for alcohol related harm (SAR)
- Elective hospital admissions for hip replacement (SAR)

# Mortality

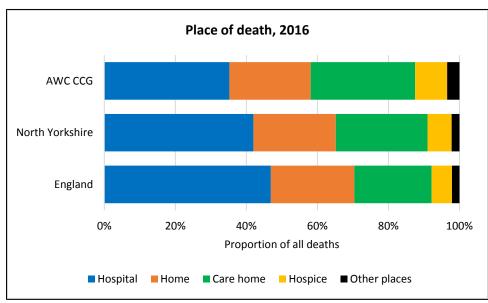

The chart below shows the directly standardised rate (DSR) of potential years of life lost (PYLL) per 100,000 registered patients and the number of observed deaths by conditions. The condition with the highest DSR is Neoplasm (730.8), while the highest number of observed deaths is from ischaemic heart diseases (154).

Source: HSCIC

#### Place of death

Within AWC CCG, 35.2% of deaths occurred in hospital, 29.4% in care homes, 22.9% at home, 9.0% in hospices and 3.5% elsewhere. Compared with England, AWC CCG has fewer people dying in hospital and at home but less people dying in care homes and hospices [9].

Source: Public Health England

Additional mortality data available in the JSNA 2018 District Profiles.
